

Population VASE Panel: Real FIRED Shape Variation

Each glyph is a real FIRED event profile: vertical axis is observed fire time; width is $\sqrt{\text{cumulative area}}$, normalized within fire.

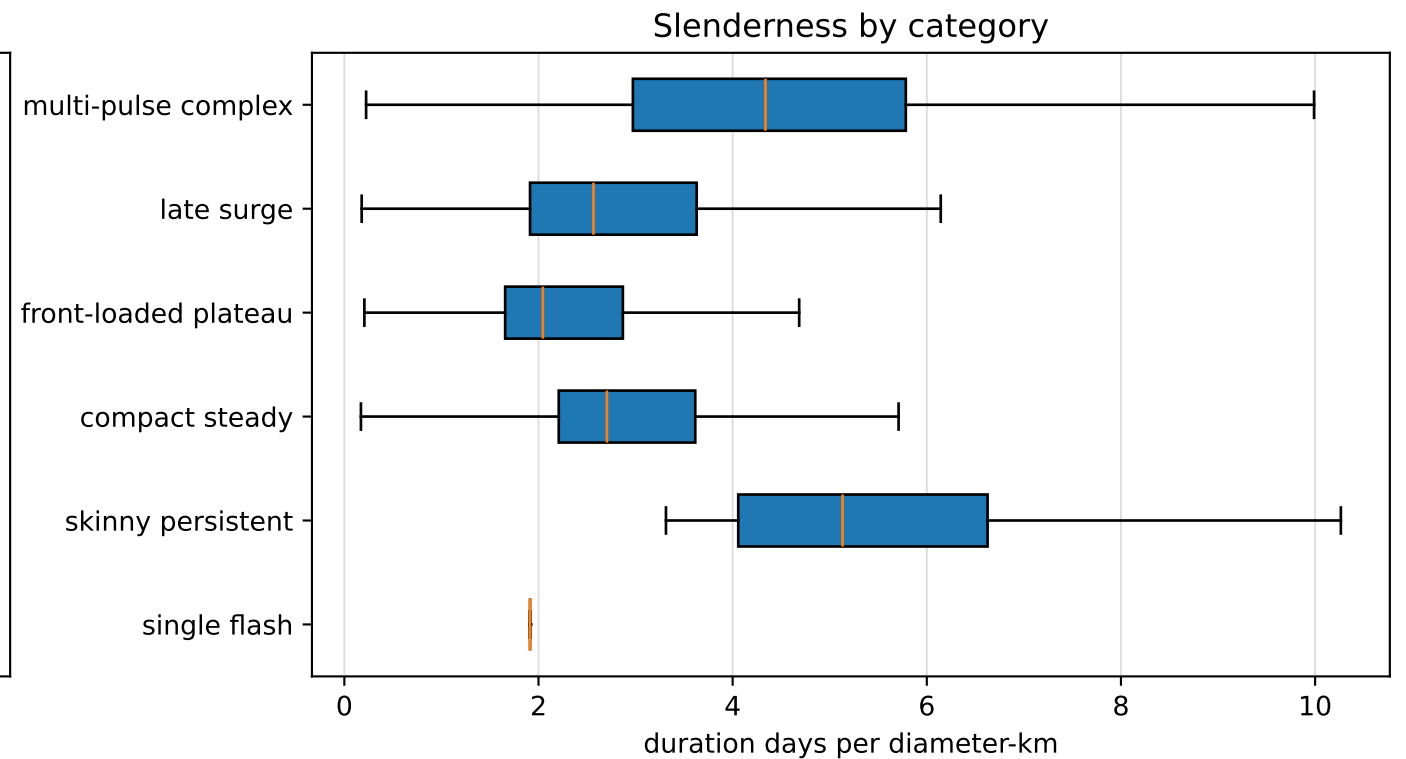

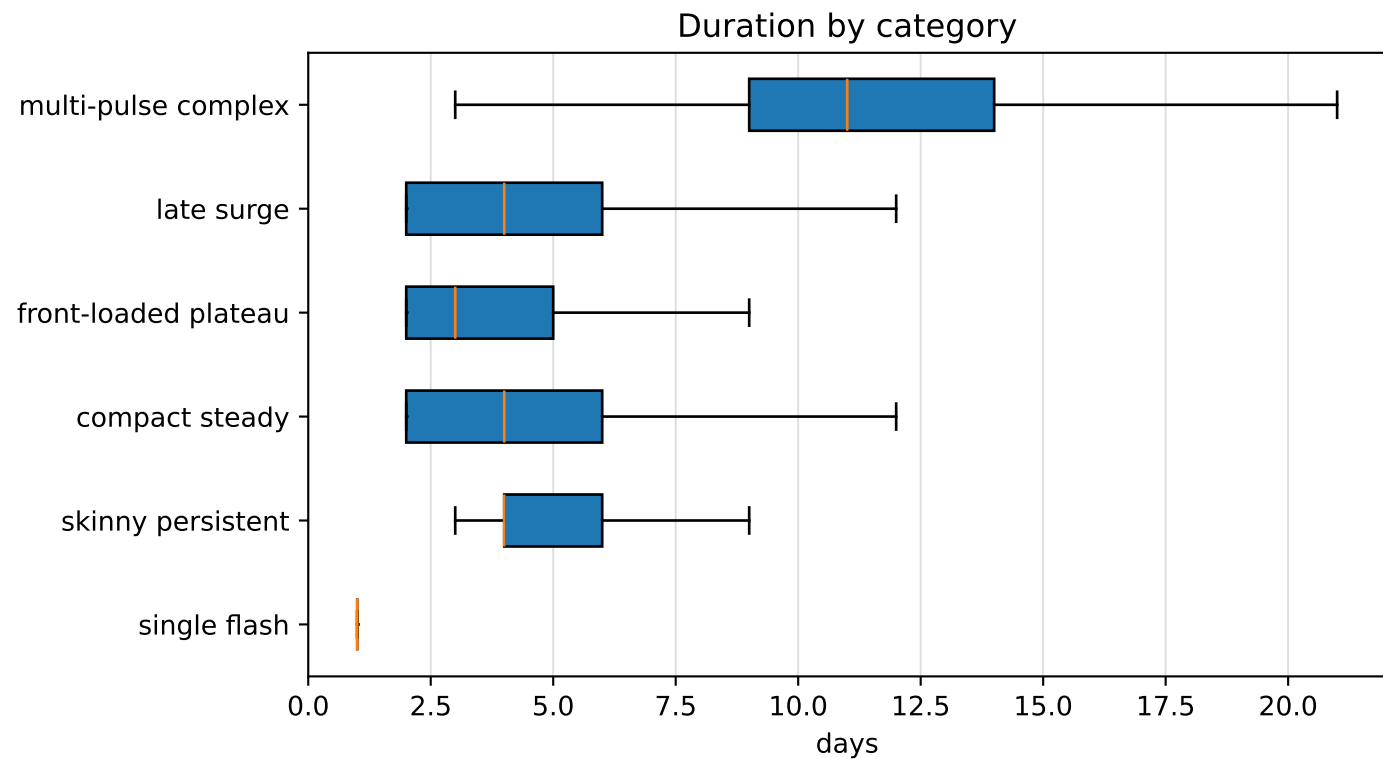

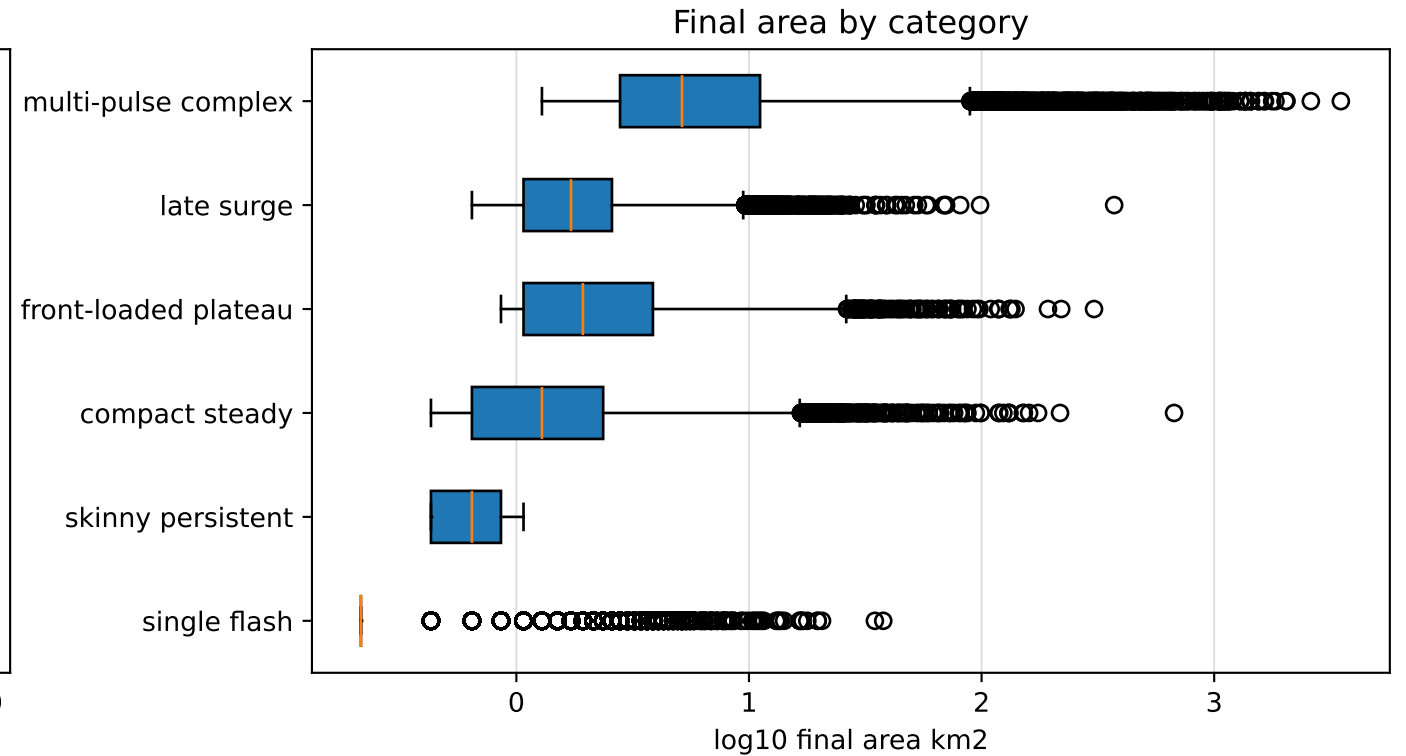

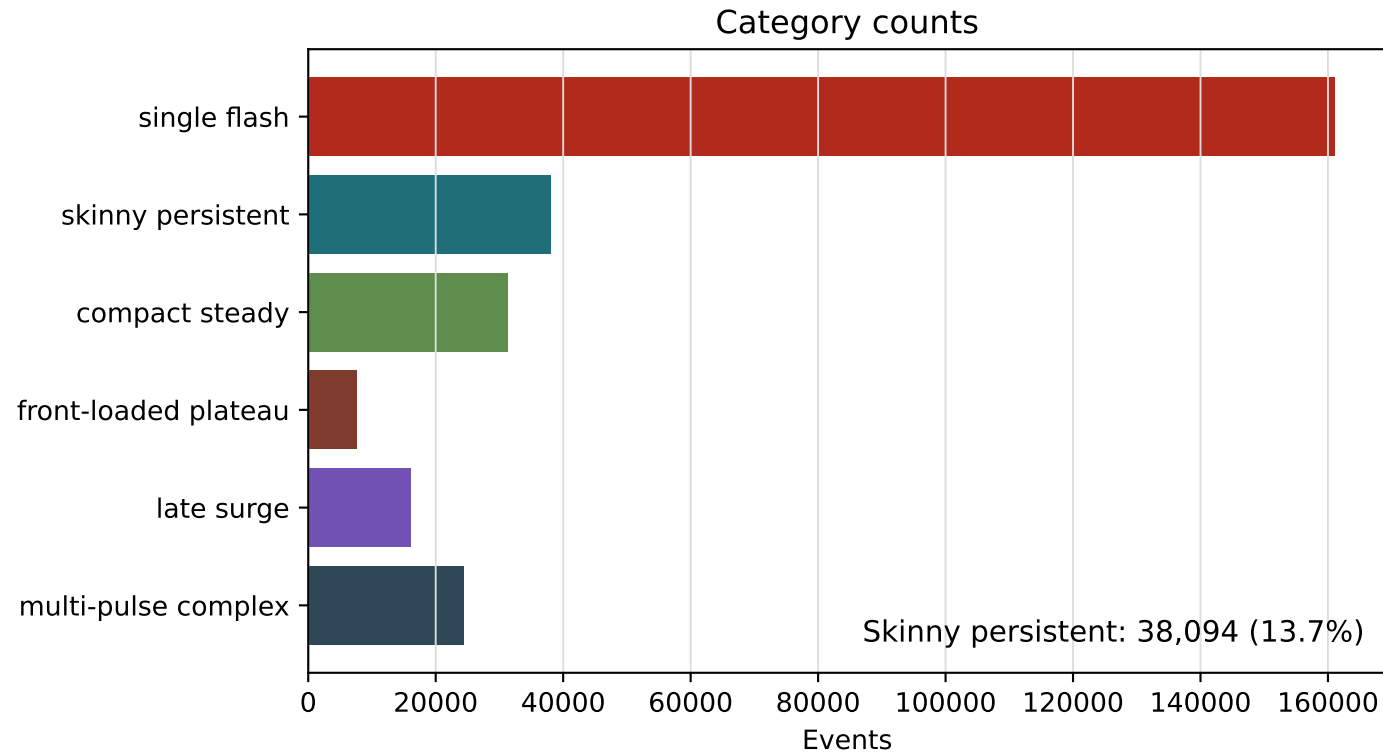

Shape Categories: Example VASE Profiles

Rows are rule-based morphology categories computed from real daily FIRED area trajectories.

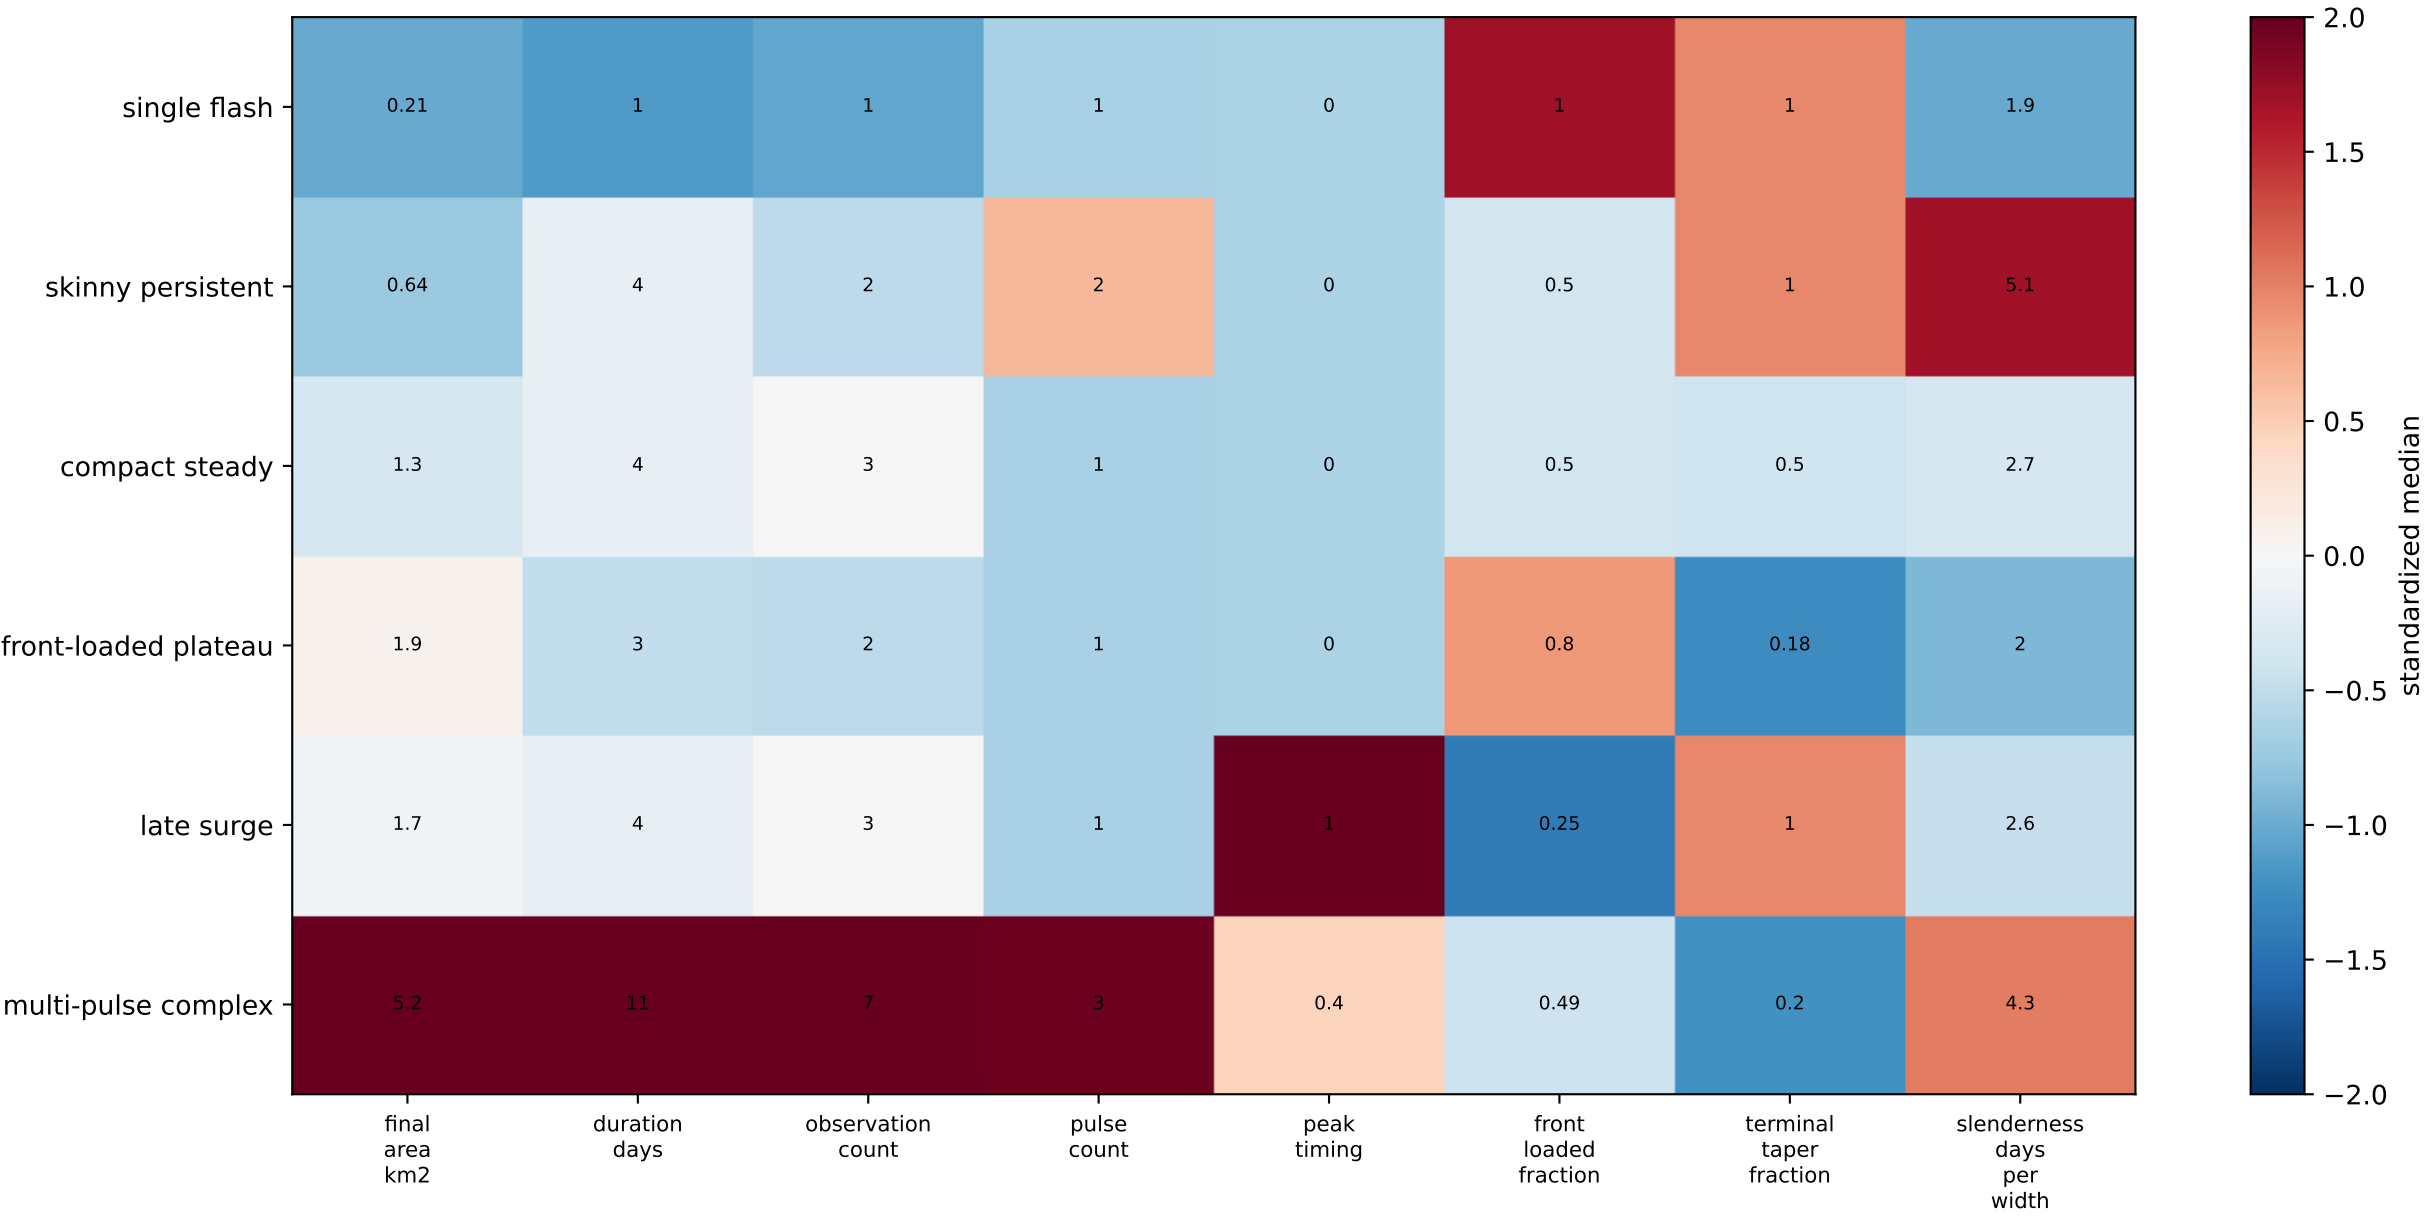

How Many Stay Skinny? What Shape Categories Appear?

Categories are population-wide, computed over 278k real FIRED events from daily area profiles.

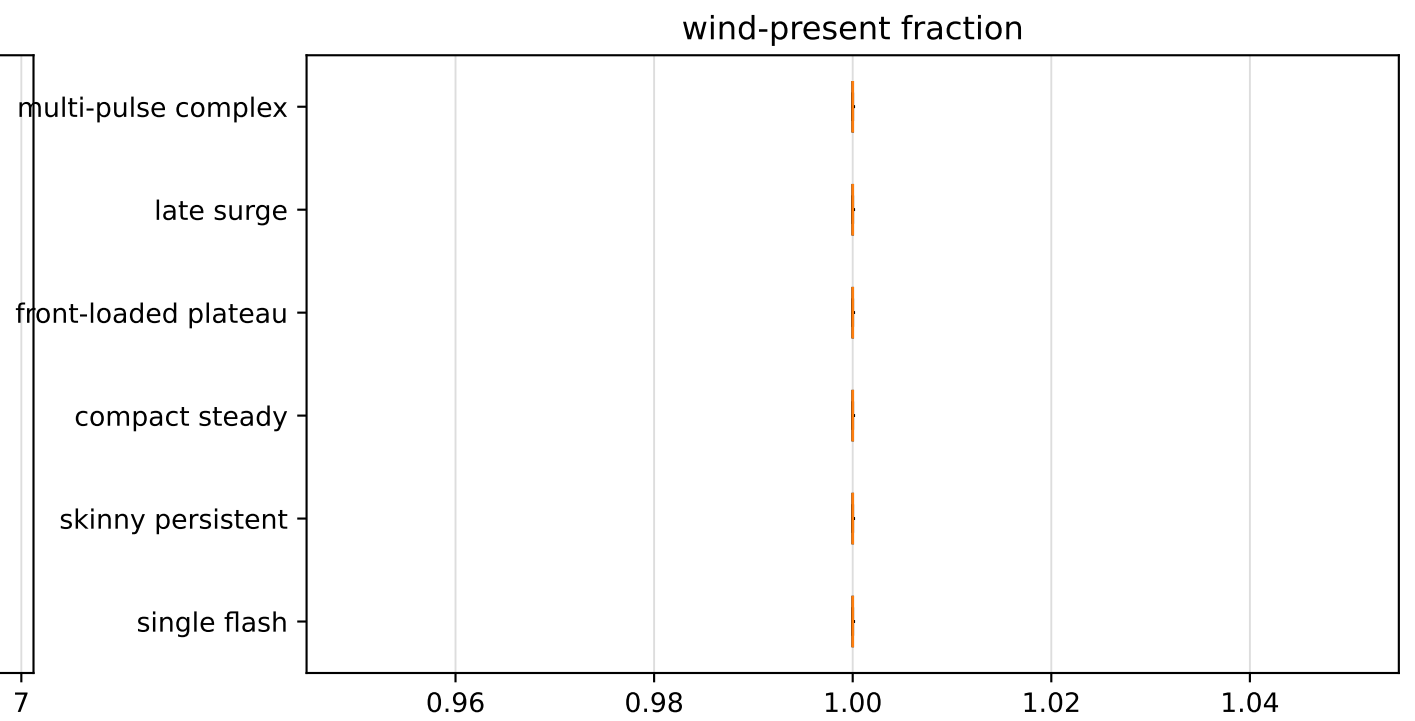

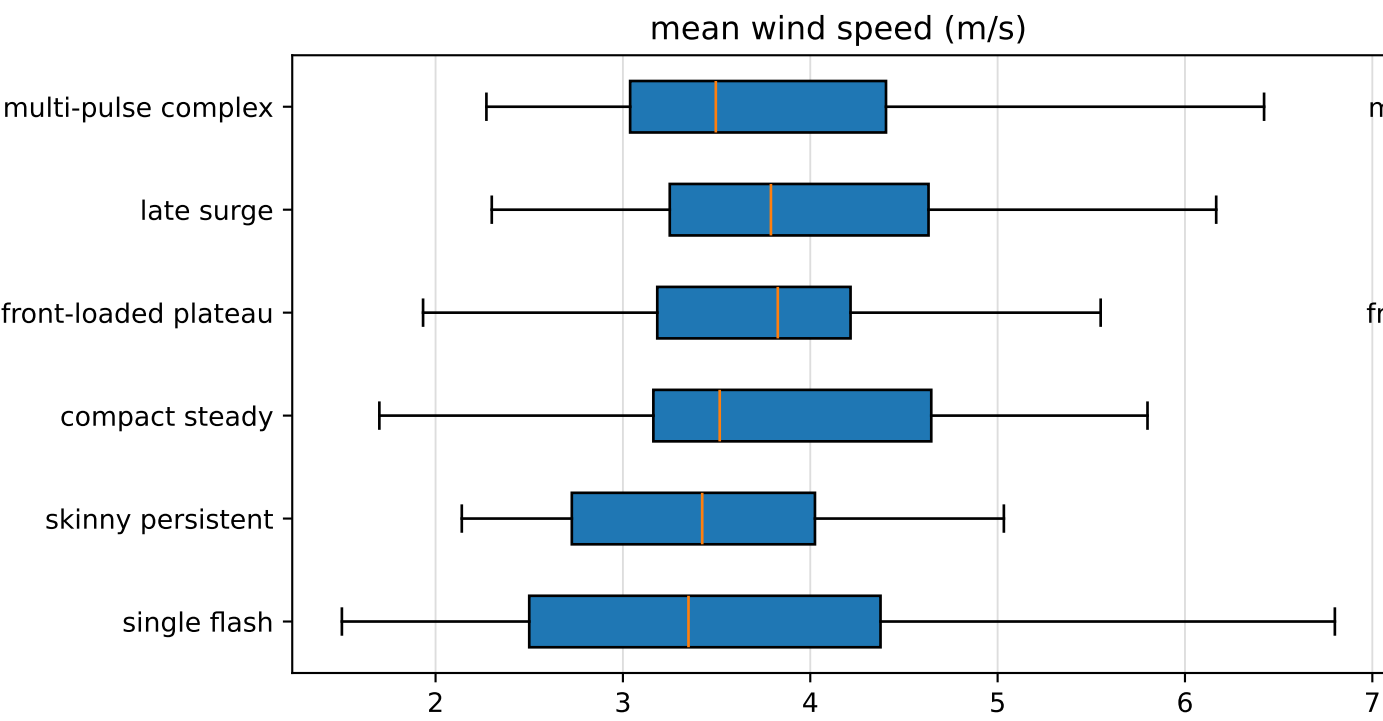

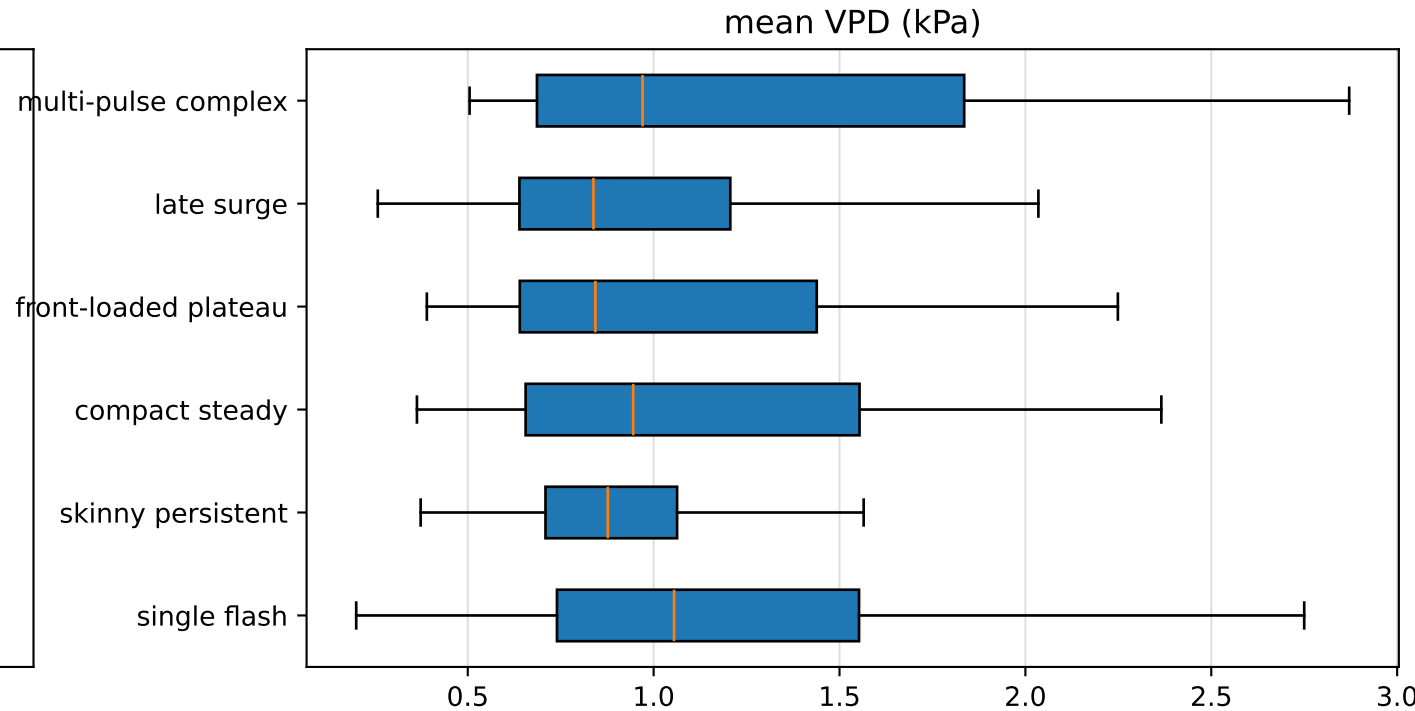

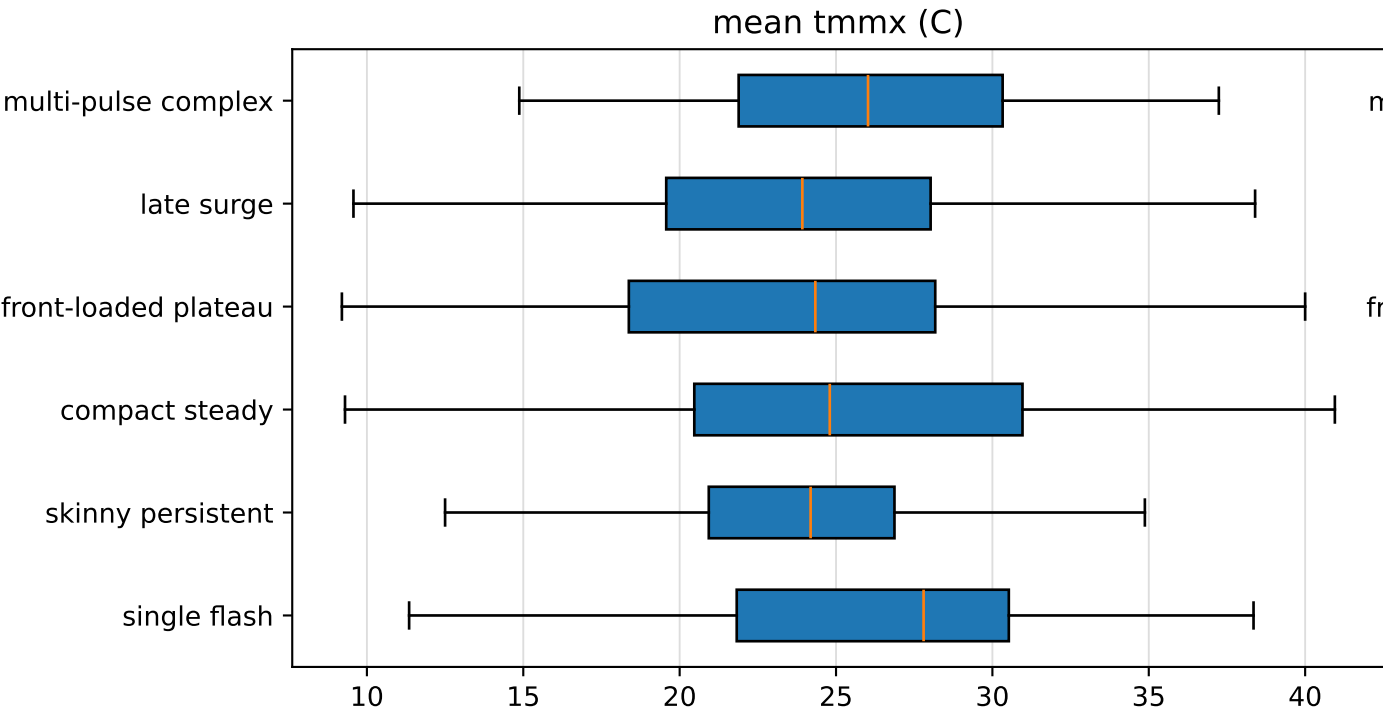

Shape Category Trait Fingerprints

Standardized median traits show what makes the categories different.

Climate Signals Vs Shape

Real gridMET climate sample, limited to cached 2001-2003 CONUS event windows.

Climate sample n=300. These are descriptive associations, not causal estimates.

Shape-Climate Trend Views

Each point is one real event in the cached climate window.
