

Fire developmental atlas: geometric life histories and environmental transitions

WHAT THE CURRENT DATA CLEARLY SHOW

100 fires and 684 usable observation-to-observation transitions are available. Evidence: strong descriptive evidence.

Task-specific QC is required: morphology is usable for 100 fires, pulse detection for 100, and terminal-observation analysis for 40. Evidence: strong descriptive evidence.

Final meaningful expansion, terminal observed record, and physical extinction are distinct quantities. Physical extinction is not observed. Evidence: strong descriptive evidence.

WHAT THE CURRENT DATA SUGGEST

The most coherent geometry-centered clock in this sample is peak expansion. Evidence: moderate descriptive evidence from alignment ranking.

Fires show pulses, pauses, repeated expansions, and prolonged low-growth intervals rather than a single uniform terminal pattern. Evidence: moderate descriptive evidence from profiles and event table.

Discrete geometry-only groups have suggestive support; best silhouette is 0.73. Continuous axes should be considered alongside clusters.

WHAT THE CURRENT DATA DO NOT SUPPORT

A common terminal climate endpoint is unsupported with current data; terminal observed records remain heterogeneous.

Causal claims about wind, VPD, or temperature triggering expansion are not supported with 100 daily fire sequences.

No prescribed-fire comparison is made or implied.

WHAT SHOULD BE ANALYZED NEXT

Expand the event sample and reduce temporal gaps before physical cessation claims.

Compute climate support on newly burned area and advancing boundaries, not only nearest grid cell to event centroid.

Use daily wind speed here only as a scalar first pass; direction, gusts, and subdaily wind remain future work.

WHAT COULD BECOME THE MANUSCRIPT

Strongest current manuscript direction: geometric developmental objects, event clocks, and continuous developmental axes.

Secondary direction: geometry-environment transitions around expansion pulses, but this needs larger sample size and better climate support.

Task-specific QC replaces terminal-cessation filtering

Section 1. Observational structure and limitations

Observed perimeter dates, missing dates inside observed sequences, pulse markers, final meaningful expansion, and terminal observed records.

Section 2. Defining the developmental object

Vase width is max projected bounding-box side in km; it is compared against, not assumed equivalent to, newly added area.

Section 4. Event detection rules and detected events

						geometric activity

Section 4. Event detection sensitivity

Expansion activity is detected from geometry only using multiple transparent thresholds.

Section 5. Alignment comparison

Which event provides the most coherent fire-centered clock?

Observed points and event-centered lags are shown; interpolated relative-age views are secondary diagnostics only.

Section 5. Alignment quality ranking

alignment_clock	n_fires	geometric_peak_concentration_within_1_obs	mean_among_fire_activity_variance	environmental_direction_consistency	minimum_lag_sample_size	question_answered	alignment_rank_for_geometry
first observed perimeter	100	0.36	6.32	nan	100	Which event provides the most coherent fire-centered clock?	2
peak expansion	100	1	16.7	0.535	47	Which event provides the most coherent fire-centered clock?	1
final meaningful expansion	100	0.35	12.8	0.52	14	Which event provides the most coherent fire-centered clock?	3
transition into geometric quiescence	56	0.214	16.5	0.531	9	Which event provides the most coherent fire-centered clock?	4
terminal observed record	100	0.11	7.62	0.55	100	Which event provides the most coherent fire-centered clock?	5

Section 5. Alignment quality visuals

Section 6. Geometric life-history traits

Geometric life-history traits organized by scientific role

Traits are grouped as size, tempo, pulse structure, persistence, and shape; skewed axes use log scales where appropriate.

Section 7. Geometry-only developmental typology

Clusters use geometry only. Weak silhouette values mean continuous axes may be more appropriate than forced types.

Section 8. Continuous developmental axes

PCA scores are accompanied by loadings so interpretation remains tied to measurable traits.

PCA loadings for continuous geometry axes

variable	PC1_loading	PC2_loading
final_area_km2	-0.386	-0.186
observed_duration_days	-0.24	-0.305
active_fraction	0.263	-0.393
peak_expansion_magnitude_km2	-0.376	-0.0783
timing_of_peak_expansion_relative_age	-0.065	0.00439
final_meaningful_expansion_relative_age	0.173	-0.461
number_of_expansion_pulses	0.0976	-0.483
terminal_taper_fraction_of_peak	0.198	-0.356
geometric_trajectory_length_km2	-0.38	-0.186
space_time_volume_km2_days	-0.357	-0.249
maximum_vase_width_km	-0.389	-0.057
mean_compactness	0.277	-0.2

Section 9. Environment around expansion events

Environment around geometry-defined developmental events

Climate describes geometry-defined events; it does not define them.

Section 10. Environmental roles

Daily maximum/minimum temperature, VPD, and scalar wind speed are compared as different temporal signals.

Section 11. Interactions and compound conditions

Transparent two-variable displays are used instead of over-parameterized models.

Section 12. State-transition view

States are exploratory geometry bins, not verified biological states.

Section 13. Terminal observation as secondary analysis

The terminal observed record is compared to peak, final meaningful expansion, and quiescence onset.

Section 14. Outlier and influence analysis

Large fires are shown explicitly; they are not silently removed.

Section 15. Sample-size and power diagnostics

Every major comparison reports fires, events, or lag contributions.

Section 16. Manuscript decision matrix: overview

story	current_evidence_rating	manuscript_potential	sample_size	robustness	strongest_figure
Wildfires converge on a common terminal climate.	unsupported with current data	low now	100	low	13_terminal_secondary_analysis
Wildfires share a common transition out of their final expansion pulse.	suggestive	moderate	100	medium	04_alignment_comparison_grid
Wildfires exhibit recurring geometric developmental trajectories.	suggestive	moderate	100	medium-low	07_geometry_clustering
Wildfire development lies along continuous geometric axes rather than discrete types.	moderate descriptive evidence	high	100	medium	08_continuous_axes_pca
Expansion pulses are associated with specific environmental states or changes.	suggestive	moderate after expansion	274	low-medium	09_event_centered_climate
Different climate variables play distinct temporal roles in wildfire development.	suggestive	moderate	100	low-medium	10_environmental_roles
Observation gaps prevent reliable inference about physical fire cessation.	strong descriptive evidence	high as limitation/design point	100	high	01_observational_structure_raster

Section 16. Manuscript decision matrix: evidence details

story	supporting_analyses	contradicting_analyses	dependence_on_definitions	additional_analysis_needed
Wildfires converge on a common terminal climate.	terminal secondary analysis	wide terminal tmmx/VPD/wind spread; censored terminal records	high	true cessation data; expanded sample; boundary climate
Wildfires share a common transition out of their final expansion pulse.	alignment comparison; final meaningful expansion events	gaps and varying quiescence persistence	medium	test pulse thresholds on larger sample
Wildfires exhibit recurring geometric developmental trajectories.	profiles; event table; clustering	cluster silhouette max 0.73	medium	stability with more fires
Wildfire development lies along continuous geometric axes rather than discrete types.	PCA loadings and scores	small sample size	medium	functional PCA and outlier sensitivity
Expansion pulses are associated with specific environmental states or changes.	event-centered climate extraction	daily time step, nearest-grid-cell climate, limited pulse count	high	larger sample; boundary climate; hourly wind optional
Different climate variables play distinct temporal roles in wildfire development.	environmental roles diagnostics	daily records smooth short wind events	medium	more events and subdaily wind if needed
Observation gaps prevent reliable inference about physical fire cessation.	observational raster; task-specific QC	none in current cache	low	independent cessation observations

Section 17. Recommended main figures

OPTION A: GEOMETRIC DEVELOPMENT PAPER

Figure 1: The vase as a fire developmental object - current data are sufficient for a descriptive figure.

Figure 2: Individual developmental profiles and detected events - current profiles are sufficient, but event rules should be sensitivity-tested on more fires.

Figure 3: Geometry-only continuous axes or stable trajectory groups - PCA axes are currently stronger than forced clusters.

Figure 4: Event-aligned expansion and quiescence transitions - current data are suggestive but limited by gaps.

Figure 5: Conceptual synthesis of wildfire developmental trajectories - appropriate as a hypothesis-generating synthesis.

OPTION B: GEOMETRY-ENVIRONMENT PAPER

Figure 1: The vase and aligned geometry-climate time series - current data are sufficient as an atlas figure.

Figure 2: Environmental conditions around major expansion pulses - suggestive only with current sample size.

Figure 3: Compound climate conditions and lagged response - needs more fires and boundary climate support.

Figure 4: Developmental states and transition probabilities - exploratory, not mechanistic.

Figure 5: Environmental trajectories across geometric development - promising but requires richer climate support.

Section 18. Final scientific interpretation - page 1

What the current data show

Observation: the cached sample contains daily fire perimeters, gaps, and nearest-grid-cell daily climate for 100 candidate fires.

Statistical result: expansion activity is uneven, with pulse-like growth, low-growth periods, and variable timing of final meaningful expansion.

Scientific inference: the current sample is consistent with fire development being organized around geometric events rather than a verified extinction endpoint.

Speculation: some fires may occupy recurring developmental pathways, but discrete groups are not yet stable enough to name mechanistically.

Section 18. Final scientific interpretation - page 2

What the current data do not yet establish

The current data do not distinguish terminal observed record from physical extinction.

The current data do not establish causal climate controls on expansion pulses.

This pattern is sensitive to observation gaps, pulse thresholds, and large-fire influence.

This result is strongest as a scientific decision atlas for manuscript selection, not as a polished causal argument.
